

Maintaining Stainless Steel

Stainless steel products cannot be regarded as completely maintenance free.

All grades and finishes of stainless steel can stain, discolour or attain a layer of grime if not properly maintained. To achieve the maximum level of corrosion resistance the surface of stainless steel must be kept clean at all times. Provided the grade, condition and surface finish were correctly selected for the particular service environment, fabrication and installation procedures were correct and that cleaning schedules are carried out regularly, good performance and long life will be achieved. The cost and frequency of cleaning stainless steel products is lower than most materials and this will often out weight higher cost prices.

Maintenance is Necessary

Warm high humidity areas such as indoor swimming pools and bathroom areas can increase the speed of corrosion and therefore need more frequent maintenance. When cleaning stainless steel it is best to follow the cleaning agents instructions [e.g. warm or concentrated] to avoid further discolouration.

Please follow the suggested methods of cleaning Stainless Steel listed on page two.
