

Oslo Series 80 Motorised Curtain Tracks

Oslo Series 80 motorised curtain tracks are an affordable system for homes, offices, hospitals and small auditoriums using standard and rollerpleat / "S"Wave curtains. Versatility is the key to controlling the motor. Flexible switching is available, including wall switching, radio and infra red remote control (either the Oslo plug/receiver and 5 channel remote or other generic brands such as Somfy, Elero, etc) as well as home management systems such as C-BUS and Dynalite, etc.

A heavy duty aluminium extrusion (32 x 26mm) creates the backbone of this system. A bayonet connection allows for quick and secure motor attachment to the track. An internal belt, running in individual channels allows traversing of curtains around bends and curves. The belt is driven by a sprocket drivewheel, supported by two sealed roller bearings. Simple adjustments of curtain travel is enabled with internal micro limit switches.

technical specs

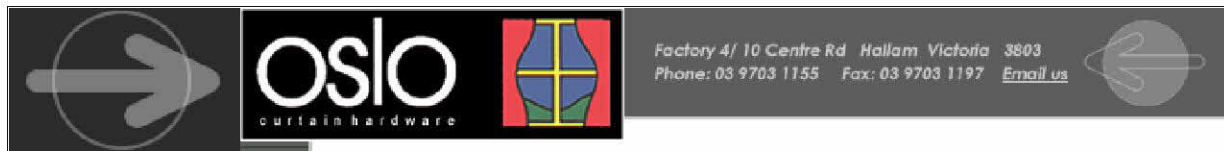

A single motor is used for most applications with four motors to choose from giving 30, 45, 60 and 80 watts of power. Tandem motors with a power range of 120 watts and 160 watts can operate very heavy curtains and very long tracks.

The motors are 240v AC synchronous vertical axis with heavy-duty roller bearings filled with a strong planetary reduction gearbox giving a smooth quiet operation.

The versatility of the **Oslo Series 80** motorised track is that it can be bent around a tight radius of 350mm as well as curves for today's modern style houses with big sweeping windows.

Other standard features include a generous overlap of the curtains, a return plate that allows the curtains to return to the wall hiding the motor, standard swivel and heavy duty wheeled runners.

Standard colours are white and clear anodised aluminium finishes. The tracking can be powdercoated to any powdercoating colours to suit your decor.

Commercial Tracking System

► *Series 80*

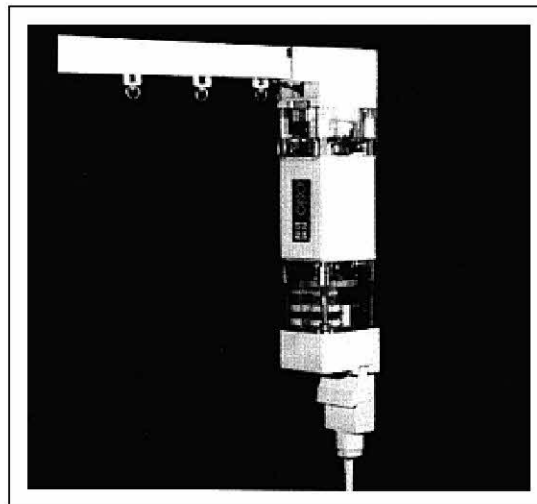

Motorised Tracking System

Oslo Series 80 motorised tracking system is suitable for offices, homes, hospitals, and small auditoriums. Versatility is the key to this system, with various switching methods available including the standard wall switch, radio remote and infra red remote control, and C - Bus.

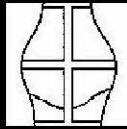

An extruded aluminium section creates the backbone of this system, easy motor connection to the track is facilitated via a bayonet connection. An internal tape drives the master carriers this allows the track to be operated around curves and bends to a minimum radius of 350mm. Internal micro limit switches allow simple adjustment of curtain travel. Heavy curtains and special requirements can be catered for by the use of a dual motor system, which doubles the power of the standard motor system. Available in white and silver.
